

WHICH ANIMALS FIND SHELTER IN THE OLD TRANSFORMER STATION?

! A new home for animals

Humans are taking away more and more space where animals live. To make sure the animals don't die out, the Species Protection Association in Franconia is working to create places where animals such as bats and birds can build their nests. They use old, empty transformer stations – small houses that were once used for power lines – and build different nesting places for birds such as barn owls, kestrels or swifts. They also use modern technology, such as a thermal chamber that gives bats a place to live. It provides young animals with special protection from the extreme cold in winter.
